

DgAmpliOp

Two operational 3-5V rail to rail operational amplifiers and 38 tie points

If you need a simple dual op-amp to amplify the signal of a sensor, the DgAmpliOp will simplify your work. A **MCP602** (compatible to LM338 with a better range) is already soldered. We used this circuit in the DgSpy and Xbot light sensors. If you are keen with electronics, you will also find good usages of this circuit.
